

Practical 11

Written By Student:

Artificial intelligence will not completely replace jobs, but it will change the way many jobs are done. In the future, AI can handle repetitive and time-consuming tasks such as data entry, calculations, and basic customer service. This may cause some jobs to disappear, especially those that do not require creativity or human judgment. However, AI will also create new job opportunities in areas like technology, healthcare, and education. People will need to learn new skills to work alongside AI, such as problem-solving and critical thinking. Instead of replacing humans, AI can help workers become more efficient and productive. Overall, AI is more likely to change jobs rather than replace them completely, and humans will still play an important role in the workplace.

Ask By ChatGPT:

Artificial intelligence is changing the world of work, but it is unlikely to replace all human jobs. Many tasks that are repetitive or simple can be done faster by AI, which may reduce the need for certain types of jobs. However, this does not mean humans will become useless. Instead, jobs will evolve, and new roles will be created that require human creativity, emotions, and decision-making skills. Fields like medicine, education, and technology will continue to need people to guide and manage AI systems. Workers will have to learn new skills and adapt to new ways of working. AI can support humans by making work easier and more efficient. Therefore, AI will mainly change jobs rather than completely replace them.

Comparison Table:

Human-Generated Content	AI-Generated Content
Created using human thinking, emotions, and experiences	Created using algorithms and data
Shows personal opinions and creativity	Based on patterns and existing information
May include emotions and personal tone	Usually neutral and factual
Can make mistakes due to human bias	Can make mistakes due to incorrect data
Takes more time and effort	Can be created quickly and efficiently
